

What Gratifi gives the bank

As of 3 October 2026 · working app at project-95d8n.vercel.app · bank, partners and customer data are mocked

1. The card

What the bank's cardholders get first. This is where the app opens.

Card at a glance	Home opens on the card: balance, how much of the limit is used, the bill and its due date, with Pay and Freeze one tap away. Card controls come next, then the card's benefits.
Card controls	One place for every control, each working straight away. Freeze and unfreeze. Where the card works: domestic and international payments, travel notices. How it pays: online, in store, contactless, cash withdrawals, phone wallets. Limits: monthly spending, each payment, daily limits for each way of paying (set separately at home and abroad), and limits by category. Spending blocks: gambling (with a cooling-off period before it lifts), crypto, money transfers and e-wallet top-ups, premium-rate lines, adult entertainment. Payment alerts: every payment, payments over an amount, declined payments with the reason. Switching off or lowering a limit is instant; switching back on or raising one needs the customer to confirm it's them.
Security	Card number and security code shown only after a check. View the PIN.
Paying the bill	Pay in full, the minimum or another amount from the bank account. Set up, change or cancel Direct Debit (full or minimum each month).
Statements and transactions	Statements by month with download. Every transaction with search and filters, and the detail of each payment. Spending shown by category.
Lost, stolen or damaged	Freeze first, then order a new card, tracked to the door and activated in the app.
Credit limit	Lower it straight away, or ask for more: the bank decides, and the answer comes back in the chat.
Disputes and fraud	Raise a dispute with reason, amount, notes and receipt, and track it as a case. Payments the customer didn't make: the card is frozen, they tick the payments, the money is credited back straight away, and a new card with a new number is sent. A suspicious payment freezes the card and asks the customer to confirm. Declined payments are explained in plain words, with a one-tap fix.
Card abroad and wallet	Travel notices, no-foreign-fee guidance, add the card to the phone wallet.
Card benefits	What the card covers (lounges, purchase protection, warranty, travel cover) and what is left this year.
Alerts	Every payment, payments over an amount, declined payments with the reason, bill reminders 1, 3 or 7 days before the due date, and statement ready. Plus orders and trips, in one place, with quiet hours.
Instalments and balance transfers	Done in the chat: pick the purchase and the plan (3, 6 or 12 months) or enter the other card and amount, see the fee up front, confirm, and track the bank's decision as a case.

2. Care and control

What the bank's risk and compliance teams will ask about.

Nothing moves without the customer	Money, points and card settings only change after a confirm step: Face ID, a one-time code or approval in the bank's own app, depending on the market.
Checked every time	Every payment is checked against available credit. The AI cannot move money or change the card itself, and cannot say something happened unless it did.

Customers in difficulty	Spots crisis, scams, coercion, financial abuse and bereavement, in English and Arabic, and brings in the right person or helpline. Money worries are handled in the chat: pay the minimum, move the due date, or ask for a payment plan with interest frozen, decided by the bank's care team; no late fees while they look. Free independent debt advice is named where it exists. Bailiff or eviction cases always go to a person.
A person when it matters	Any request can go to a person at the bank, who sees the whole conversation.

3. How it plugs into the bank

One connection layer	Every service is a module that switches on only when the bank has the API behind it (34 API connections listed). If an API is missing, the service is simply not in the app.
Each bank on its own	Every bank gets its own separate instance, under its own brand. No data or traffic is shared between banks.
Model can be swapped	The AI model behind it can be changed at any time; the bank's rules and data stay the same.
Markets	UK, EU (Ireland), India, UAE, UAE in Arabic (right to left), Singapore and Malaysia, each with local money, prices and how payments are approved.
Ships as a web app	Installs from a link like an app; no app-store build needed.

4. Rewards that drive card spend

Second, and built to grow spend on the card.

Points	Balance, history, points about to expire, and what they are worth. Pay off a card purchase with points, send points to family, and claim missing points.
Card offers	Offers linked to the card, earned as the customer spends.
Challenges	Spend-and-earn challenges the customer joins and tracks.
Transfers	Move points to airline and hotel programmes.
Grow and give	Points into gold, funds or savings through a licensed partner, or donated to charity.

5. Where points are spent

Partner services, finished inside the chat with points, card or both.

Travel	Flights (fares, seats, bags, extras, check-in, live status, upgrades, changes and cancellations, price watch, coming home from a different city), stays (change dates, extra nights, late checkout, breakfast, messages to the hotel), airport lounges and fast track, rides, rail and coaches (change, cancellations), car hire (extend, change the date, what to bring), experiences, visa help, travel cover with claims, and eSIM with install and top-up.
Everyday	Dining (change the table, running late, messages to the restaurant), groceries with delivery now or later and a choice on substitutes, shopping with returns, tracking and price watch, gift cards (code replaced if it fails), subscriptions with renewal reminders, events and cinema (waitlist for sold-out tickets, official resale, sending tickets to a friend, changing a showing). If an organiser cancels, everything is refunded and similar options are offered.
Concierge	Anything else, such as a sold-out table or a special gift, handled by a person.

Order of this page follows the app: the card first, then rewards that grow card spend, then the partner services where points are spent.
